Running NutriAI Locally

Prerequisites

1) Node.js

- a) Open a web browser and navigate to <https://nodejs.org/en/download>
- b) Either follow the on-screen commands or download the prebuilt binary and follow the on-screen instructions
- c) Once installed, open terminal/command prompt and verify it is installed by running the command
 - i) **node -v**
 - (l) Should print the version of Node.js. If not ensure that you properly installed Node.js

2) npm

- a) This comes preinstalled with Node.js. To verify npm is installed run the command
 - i) **npm -v**
 - (l) Should print the version of npm. If not ensure that you properly installed Node.js

3) MongoDB

- a) You can either setup your database with MongoDB Atlas, which is a cloud based Mongo Database managed by MongoDB, or you can install the MongoDB Community Server locally on your machine by following the instructions here:
<https://www.mongodb.com/try/download/community>

4) Python

- a) Navigate to <https://www.python.org/downloads/> and download the latest version of Python and follow the instructions in the installer
- b) Once installed, open terminal/command prompt and verify that it is installed by running the command
 - i) **python3 --version** # Use this for unix systems
 - ii) **py --version** # Use this for windows

5) OpenAPI

- a) You will need to setup an OpenAI account at <https://www.openai.com> and login to the API platform
- b) Create a project, add funds and obtain your API key.

Building and Starting Server

Starting the AI Recommender Server

- 1) Clone the repository using:
 - a) git clone <https://github.com/htmw/2026SA-TechDocs.git>
- 2) First start the AI recommender server
- 3) Navigate to **python-api** folder
- 4) Run the command **python -m venv .venv** to create a virtual environment
 - a) For mac/Unix: **python3 -m venv .venv**
- 5) Once the environment has been created run the command **.venv\Scripts\activate** to enter the virtual environment
 - a) For mac/Unix: **source .venv/bin/activate**
- 6) Run **pip install -r requirements.txt** to install the Python dependencies
- 7) Run **uvicorn main:app** to start the Python Server
- 8) The AI Recommender Server will now be running on port 8000
 - a) The port can be changed using the **--port** option
 - i) **uvicorn main:app --port <PORT>**

Starting the NutriAI Application

- 1) Now navigate back to the root folder of the project
- 2) Navigate to the **code** directory
- 3) Make a copy of the **env.example** file and remove the copy to **.env**
- 4) Enter your MongoDB URI into the **MONGODB_URL** field
 - a) Make sure the URL includes the database name
- 5) Enter the url of AI Recommender Server into the **AI_RECOMMENDER_URL** field
 - a) Since the server is running locally, it will be <http://127.0.0.1:8000>
 - i) Note: if you changed the port in the previous step, please change 8000 with the custom port
- 6) Enter your OpenAI API Key into the **OPENAI_API_KEY** field
- 7) Run **npm install** to install of the dependencies
- 8) Run **npm run build** to build the project
- 9) Run **npm run start** to start the server
- 10) The server should now be running on port 3000
 - a) Note: to change the port, modify the start command in package.json

- b) Modify this line
 - i) "start": "next start" -> "start": "next start -p <PORT>",
- c) Change port to whatever you need

Running on Vercel

Fork NutriAI

- 1) Login/Create a Github Account
- 2) Navigate to <https://github.com/htmw/2026SA-TechDocs.git>
- 3) Fork the Github Repo

Setting up AI Recommender

- 1) Login/Create a Vercel account
- 2) Start a new Vercel Project
- 3) On the **New Project** screen, connect your Github account where you forked the NutriAI repository
- 4) Once your Github account is connected, make sure Vercel has permission to view the repository.
- 5) Once everything is connected and Vercel can see the repository, click **Import** next to the repository.
- 6) You will now be presented with a page to setup the project
 - a) Change the **Application Preset** to **FastAPI**
 - b) Change the **Root Directory** to **python-api**
- 7) Once complete, click **Deploy**
- 8) Once the deployment has finished you will be brought to a Congratulations page where it will show you a preview of the AI Recommender service.
 - a) If the preview shows a json with a message that says **NutriAI FastAPI Recommender is running.**
You are good to go, if not please try setting up again.

Setting up NutriAI Project

- 1) Navigate to vercel.com and create an account
- 2) Click **Add New -> Project**

- 3) On the **New Project** screen, connect your Github account where you forked the NutriAI repository
- 4) Once connected select the forked repository and click **Import**
- 5) You will now be presented with a page to setup the project
 - a) Change the **Application Preset** to **Next.js**
 - b) Change the **Root Directory** to **code**
 - c) Add the Environment Variables
 - i) **MONGODB_URL** - this is the url of the MongoDB, this must include the database name
 - ii) **APP_NAME** - this should be the name of the app, NutriAI
 - iii) **AI_RECOMMENDER_URL** - the url of the AI Recommender that was setup in the previous step
 - iv) **OPENAI_API_KEY** - this can be obtained from your OpenAI account.
- 6) Once complete, click **Deploy**
- 7) Once the deployment has finished you will be brought to a Congratulations page where it will show you a preview of NutriAI
 - a) If the preview shows the frontpage of NutriAI then NutriAI has been successfully deployed otherwise try the setup again.
